# Types of Sequences?

## Types of Sequences

Sequences by the  
Math

Elements

## Properties of Sequences

Quiz 1

- Strings, which are sequences of characters.
- Files contain a sequence of lines and the lines are sequences of characters.
- Objects, over which the `range()` function, can iterate

## Examples

```
for element in [1, 2, 3]: # lists
    print(element)
for element in (1, 2, 3): #sets
    print(element)
for key in {'one':1, 'two':2}: #dictionaries
    print(key)
for char in "123": #strings
    print(char)
for line in open("myfile.txt"): # open, read a file
    print(line, end='')

```

# Building Tuples

Sequences

Quiz 1

## Building Tuples in Python

```
# Creating non-empty tuples
myTuple = 'tea', 'coffee'
print(myTuple)
print(type(myTuple))
```

## Or, Use Parenthesis to Build Tuples in Python

```
myOtherTuple = ('Bagels', 'Donuts')
print(myOtherTuple)
print(type(myOtherTuple))
```

# Tuples and $n$ -Tuples

## Mathematically Speaking...

### Types of Sequences

#### Sequences by the Math

#### Elements

### Properties of Sequences

#### Quiz 1

- In mathematics, a *tuple* is a finite ordered list (sequence) of elements
- An  $n$ -tuple is a sequence (or ordered list) of  $n$  elements ( $n$  is a positive integer).
  - Ex:  $(2, 7, 4, 1, 7)$  denotes a 5-tuple.

## General Rule About Equality

- The general rule for the identity of two  $n$ -tuples is
$$(a_1, a_2, \dots, a_n) = (b_1, b_2, \dots, b_n) \text{ if and only if } a_1 = b_1, a_2 = b_2, \dots, a_n = b_n$$

$a = (1, 2, 3)$

$b = (1, 2, 3)$

$a == b$  # test?

$b = (1, 3, 2)$

$a == b$  # test?

# Tuples and $n$ -Tuples

## Mathematically Speaking...

### Types of Sequences

#### Sequences by the Math

#### Elements

### Properties of Sequences

#### Quiz 1

- 1 A tuple may contain multiple instances of the same element,  
**tuple**  $(1, 2, 2, 3) \neq (1, 2, 3)$  but,  
**set**  $\{1, 2, 2, 3\} = \{1, 2, 3\}$
- 2 Tuple elements are ordered,  
**tuple**  $(1, 2, 3) \neq (3, 2, 1)$  but,  
**set**  $\{1, 2, 3\} = \{3, 2, 1\}$
- 3 A **tuple** has a finite number of elements (also known as  $n$ -tuples), while a set or a **multiset** may have an infinite number of elements.

```
a = (1,2,3)
s = set({1,2,3})
a == s # test?
```

# Elements of Tuples

## Types of Sequences

Sequences by the  
Math

Elements

## Properties of Sequences

## Quiz 1

- Sequences are not generic: they usually contain similar types of elements.
  - Ex: Lists contain same types of data structures, strings contain chars, files contain lines
- Sequences and  $n$ -tuples
  - $n$ -tuples: An ordered set with  $n$  elements
    - Ex: File sequences are not  $n$ -tuples because they can contain any number of lines

# Properties of Sequences

## Commutative

### Types of Sequences

### Properties of Sequences

#### Commutative

#### Identity

#### Concatenation

#### Associative

#### Monoids

### Quiz 1

## Commutative

- The term “commutative” is used in several related senses.
- A binary operation  $*$  on a set  $S$  is called *commutative* if:  
 $x * y = y * x$  for all  $x, y \in S$ 
  - An operation that does not satisfy the above property is called *non-commutative*.
- One says that  $x$  *commutes* with  $y$  under  $*$  if:  $x * y = y * x$
- A binary function  $f : A \times A \rightarrow B$  is called *commutative* if:  
 $f(x, y) = f(y, x)$  for all  $x, y \in A$

Quiz 1

## Formal Definition of Identity

- **Identity:** There exists an element  $e \in S$  such that for any  $a \in M$ ,  $e * a = a * e = a$

# Properties of Sequences

## Commutative's Identity Property

Types of  
Sequences

Properties of  
Sequences

Commutative

Identity

Concatenation

Associative

Monoids

Quiz 1

### Identity

- An identity is an equality relation  $a = b$ ,
- Ex:  $a$  and  $b$  equal some numeric value.
  - $a + b == a + b$
  - $a + b == b + a$
  - $a * b == a * b$
  - $a * b == b * a$

- $a = a + e$
- $a + e = a$
- $a$  is non-empty, contains some element
- $e$  must be an empty sequence or is equal to 0
  - $e$  has an *identity* property, meaning that it does not influence the operations
- $a * e = a$  or  $a = a * e$ , (what is  $e$ , the identity here?)

# Properties of Sequences

## Identity

Types of  
Sequences

Properties of  
Sequences

Identity

Concatenation

Associative

Monoids

Quiz 1

## Additive Identity

$$a + (0) = a$$

$$0 + (a) = a$$

Remember: Zero (0) preserves the Identity of every number during addition.

```
a = 1
```

```
b = 0
```

```
a == a + b #make a truth test
```

```
a + b == a #make another truth test
```

# Properties of Sequences

## Non-Commutative operations

### Types of Sequences

### Properties of Sequences

#### Commutative

#### Identity

#### Concatenation

#### Associative

#### Monoids

### Quiz 1

- Washing and drying clothes resembles a noncommutative operation; washing and then drying produces a markedly different result to drying and then washing.
- Putting on left and then right socks on feet is commutative
- Putting on shirt and then sweater is not-commutative

## Strings

```
a = "face"
b = "book"
a + b == b + a # run the test!
"facebook" != "bookface"
```

# Properties of Sequences

## Concatenation

Types of  
Sequences

Properties of  
Sequences

Commutative  
Identity

Concatenation

Associative

Monoids

Quiz 1

- Definition: a series of interconnected things or events. The concatenation is to place one string after another. The order of placement is significant to the final product.

### Ex: Concatenation of sequences

```
a = ("This", "Is")
type(a)
b = ('Loads', 'Of', 'Fun', ':-)')
type(b)
c = a + b
print(c)
( 'This', 'Is', 'Loads', 'Of', 'Fun', ':-)' )
type(c)
```

# Properties of Sequences

Types of  
Sequences

Properties of  
Sequences

Commutative

Identity

Concatenation

Associative

Monoids

Quiz 1

## Formal Definition of Associativity

- **Associativity Addition:** For any  $a, b, c \in S$ ,  $a + (b + c) = (a + b) + c$
- **Associativity Multiplication:** For any  $a, b, c \in S$ ,  $a * (b * c) = (a * b) * c$

# Properties of Sequences

## Associative Property

### Types of Sequences

### Properties of Sequences

Commutative

Identity

Concatenation

Associative

Monoids

### Quiz 1

- Definition: The associative property states that you can add or multiply regardless of how the numbers are grouped.
- Concatenation of sequences with the associative property

- $(a + b) + c = a + (b + c)$  for any strings  $a$ ,  $b$  and  $c$ .

$a, b, c = 1, 2, 3$

$(a + b) + c == a + (b + c)$

- $(a * b) * c = a * (b * c)$  for any strings  $a$ ,  $b$  and  $c$ .

$a, b, c = 1, 2, 3$

$(a * b) * c == a * (b * c)$

# Properties of Sequences

## Associative Property

Types of  
Sequences

Properties of  
Sequences

Commutative

Identity

Concatenation

Associative

Monoids

Quiz 1

Generalized Associative Law: Keep variables in same order

- $((ab)c)d$
- $(ab)(cd)$
- $a(bc)d$
- $a((bc)d)$
- $a(b(cd))$

### To Note:

- **Associative:** Variables kept in same order, operators may change order
- **Commutative:** Variables may change order, operators kept in same order.

# Let's Apply Sequences

## Modelling Interest Rates

Types of  
Sequences

Properties of  
Sequences

Commutative

Identity

Concatenation

Associative

Monoids

Quiz 1

Problem:

Put  $x_0$  money in a bank at year 0. What is the value after  $N$  years if the interest rate is  $p$  percent per year?

Solution:

The fundamental information relates the value at year  $n$ ,  $x_n$  to the value of the previous year,  $x_{n-1}$ .

$$x_n = x_{n-1} + \frac{p}{100} * x_{n-1}$$

Start with  $x_0$  and then calculate  $x_1$ , then  $x_2$ , and onward...

# The output of the program?

## Types of Sequences

## Properties of Sequences

Commutative

Identity

Concatenation

Associative

Monoids

## Quiz 1

- $x_0 = 100000$  # initial amount
- $p = 3.92$  # interest rate
- $N = 6$  # number of years

```
At year = 0 Current value is = 103920.0
At year = 1 Current value is = 107993.664
At year = 2 Current value is = 112227.0156288
At year = 3 Current value is = 116626.31464144896
At year = 4 Current value is = 121198.06617539376
At year = 5 Current value is = 125949.0303694692
```

Test these values online

- For example: [http://www.moneychimp.com/calculator/compound\\_interest\\_calculator.htm](http://www.moneychimp.com/calculator/compound_interest_calculator.htm)

## Monoid: Staveley's Definition, Section 6.2, pp. 59

Both strings with concatenation and integers with addition are examples of the mathematical structure called a monoid. A monoid is a set that has an associative binary operator and an identity element.

More formally, a *monoid* is an ordered pair  $(S, \otimes)$  such that  $S$  is a set and  $\otimes$  is some **binary operator**, satisfying these conditions:

- ① For all  $a$  and  $b$  in  $S$ ,  $a \otimes b$  is defined and is also in  $S$
- ② For all  $a, b$  and  $c$  in  $S$ ,  $(a \otimes b) \otimes c = a \otimes (b \otimes c)$
- ③ There is an element  $e$  in  $S$  such that, for all  $a$  in  $S$ ,  
 $e \otimes a = a \otimes e = a$
- ④ Then we also say that  $S$  is a *monoid* under  $\otimes$ , with identity  $e$

## Rounding errors

- The Python floating-point numbers are not quite a monoid under addition: for floating-point operands,  $(a + b) + c$  is often not exactly equal to  $a + (b + c)$  because of the error during round-off processes
- The same is true of multiplication.

## Values round to 1, or do they?

```
a = 0.9999999999999999
b = 0.9999999999999999
a == b #False
```

### Min Function

- The Min function,  $\min(x, y)$ , is defined to be  $x$  if  $x \leq y$  and  $y$  otherwise.
- We treat  $\min$  as an operator and so,  $x \min y$  is an operator (like the  $\max$  operator)
- Here,  $\min$  is both associative and commutative, and the identity value is obtained from `float("inf")` (an inferior value)

### Max Function

- The Max function,  $\max(x, y)$ , is defined to be  $x$  if  $x \geq y$  and  $y$  otherwise.
- We treat  $\max$  as an operator and so,  $x \max y$  is an operator
- Here,  $\max$  is both associative and commutative, and the non-negative integers are a monoid under  $\max$ , with identity 0

Monoids

Quiz 1

$$\begin{array}{ccccccc}
 s_0 & s_1 & s_2 & \dots & s_n & & s_0 & s_1 & s_2 & \dots & s_n \\
 \underbrace{\hspace{10em}} & & & & & & \underbrace{\hspace{10em}} \\
 + & & & & & & \otimes
 \end{array}$$

**Figure:** The operator '+' is associative, the operator  $\otimes$  behaves as an associative

- Knowing that one type of calculation is monoid allows us to use monoid-type code on it.

- Given on Friday 28th during class time (11am)
- Online format
- One hour to complete
- Ten questions: Multi-choice, True/False, Matching and Short Essay
- Picking out bugs of code or determining output

# What to study

Types of  
Sequences

Properties of  
Sequences

Quiz 1

- **Slides, notes, with chapters to add detail to class material**
- Main ideas behind mathematical subjects in class (again, study your slides)
- Python basics and code
  - Study the code from the practicals and covered in class to understand the how programs worked.
  - Mathematical operators: using doing calculations on in the interpreter with Python
  - for loops using `range()`
  - Iterations over sequences
  - Strings, characters, integers, floats
  - Sequences, sets, lists, dictionaries, tuples
  - Conditional statements
