Python

Dictionaries

Randomly  
Choosing  
Elements

This week's  
Lab

- German mathematician: 19 February 1845 - 6 January 1918
- Function definition: established the importance of one-to-one correspondence between the members of two sets
- Defined infinite and well-ordered sets
- Proved that the real numbers (*rational* and *irrational*) are more numerous than the natural numbers (*counting* numbers)

## What is a set?

- A collection of distinct objects is in mathematics, considered to be *an object* in its own right.
  - For example, the numbers 1, 2, and 3 are distinct objects when considered separately, but when they are considered collectively they form a single set of size three, written  $\{1,2,3\}$ .
- Set theory is now a ubiquitous part of mathematics,
- May be used as a foundation from which nearly all of mathematics can be derived (From 19<sup>th</sup> century mathematical thinking!)

# Types of Sets

One decides which elements make up a set

Set of Circles

Set of Triangles

## Intentional definition of sets

- $A_1$  is the set whose members are the first four positive integers.
- $B_1$  is the set of colors of the Union Jack (i.e., the British flag)

# Types of Sets

Sets of members in curly brackets

Python

Dictionaries

Randomly  
Choosing  
Elements

This week's  
Lab

## Extensional definition of sets

- $A_2 = \{4, 2, 1, 3\}$ 
  - The first four positive numbers
- $B_2 = \{\text{Blue, Red and White}\}$ 
  - The set of colors of the Union Jack (the British flag)
- $F = \{n^2 - 4 : n \text{ is an integer; and } 0 \leq n \leq 19\}$ 
  - The set of all values gained from plugging in  $n$  between 0 and 19 into the equation  $n^2 - 4$

# Types of Sets

Extensional definition of sets: a list of its members in curly brackets

## Sets

### Sets by the Math

### Order

### Sets in Python

### Lists in Python

### Tuples in Python

### Dictionaries

### Randomly Choosing Elements

### This week's Lab

- **Intentional Definition:**

- $A_1$  is the set are the first four positive integers.
- $B_1$  is the set of colors of the Union Jack

- **Extensional Definition:**

- $A_2 = \{4, 2, 1, 3\}$
- $B_2 = \{\text{Blue, Red and White}\}$

Specify a set *intentionally* or *extensionally*

In the examples above, for instance,  $A_1 = A_2$  and  $B_1 = B_2$

# Listing Elements in Sets

## Sets

### Sets by the Math

#### Order

## Sets in Python

## Lists in Python

## Tuples in Python

## Dictionaries

## Randomly Choosing Elements

## This week's Lab

- In extensionally defined sets, members in braces can be listed two or more times,
  - For example,  $\{11, 6, 6\}$  is identical to the set  $\{11, 6\}$
- Order of members is not important
  - For example,  $\{6, 11\} = \{11, 6\} = \{11, 6, 6, 11\}$

Similar to the equivalence of these pie charts:  
the content is the same in both cases

# Sets with Notation

## Creating a set of chars

```
x_st = set("This is a set")
x_st    # or print(x_st)
        # the unordered chars are the elements
        # {'s', 'T', ' ', 'e', 't', 'h', 'i', 'a'}
print(type(x_st))
        # <class 'set'>
```

## Creating a set of string(s)

```
x_st = set(["This is a set"])
x_st    # or print(x_st)
        # only one element in set; the string itself
        # {'This is a set'}
x_st = set(["This", "is", "a", "set"])
        # each word is an element
        # {'This', 'is', 'set', 'a'}
```

### Tuples in Python

### Dictionaries

### Randomly Choosing Elements

### This week's Lab

## Cloning and removing from original

```
x = {'e', 'd', 'a'}
v = x
print(x)    # {'a', 'e', 'd'}
print(v)    # {'a', 'e', 'd'}
x.remove('a')
x    # {'e', 'd'}
v    # {'e', 'd'}
v.remove('d')
x    # {'e'}
v    # {'e'}
```

$x = v$  does not make a copy of  $x$ . Instead this is a reference from one object to another.

This week's  
Lab

## Lambda function definition

- The lambda operator or lambda function is a way to create small anonymous functions (i.e. functions without a name), and are *throw-away* functions

## General syntax

lambda argument\_list: expression

```
g = lambda x: 3*x + 1  
g(2) # 7
```

```
sum = lambda x, y : x + y  
sum(3,4) # 7
```

## This week's Lab

## List comprehensions definition

- List comprehensions provide a concise way to create lists (or sets)

## General syntax

[ expression for item in list if conditional ]

## Make list

```
[i for i in range(10)]  
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
```

## Assign list to variable

```
b_list = [i for i in range(10)]  
type(b_list)  
<class 'list'>
```
