About Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

- www.python.org
- Download python3 if you are using your own hardware

- Is an interpreted, object-oriented, high-level programming language with dynamic semantics.
- Excellent for Rapid Application Development thanks to Its high-level built in data structures, combined with dynamic typing and dynamic binding
- A scripting language for tool-making or automation
- Used for *quick and dirty* solutions, quick automation, or to connect existing components together from other languages.

About Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

- Python's simple, easy to learn syntax emphasizes readability and therefore reduces the cost of program maintenance.
- Python supports modules and packages, which encourages program modularity and code reuse.
- The Python interpreter and the extensive standard library are open source and freely available in all major platforms

Users of Python Programming

- Industrial Light and Magic (George Lucas to create the FX for Star Wars).
- Google
 - Googles very first web-crawling spider was first written in Java 1.0 and was so difficult that they rewrote it into Python.
- Facebook
 - Responsible for multiple services in infrastructure management
- Netflix
 - Used to power data analyses tasks from the server side
- Dropbox
 - Built its API in Python
- And others; Instagram, Spotify, Quora, Reddit

Running the Shell

Python

About Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

From your terminal window

```
python3
```

```
Python 3.6.1 (v3.6.1:69c0db5050, Mar 21 2017, 01:21:04)
[GCC 4.2.1 (Apple Inc. build 5666) (dot 3)] on darwin
Type "help", "copyright", "credits" or "license" for
more information.
>>>
```

- Depending on where you run this, you may have a slightly different version number.

Running the Python3 Shell

Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

- Type statements or expressions at prompt:
- `print(" Hello, world")`
- `x = 12**2`
- `print(x)`
- `print(x/2)`
- `# bla bla bla...`
 - (this is a comment: everything after the # is ignored)

Watch out!

Python uses white spaces to define the functions and sections of code. If you have a bug in your code, check that the tabs are defining the blocks correctly.

Data types

Note: Use identifiers to help you remember the types!

Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

- Integers, counting numbers
 - `num_int = 1`
- Floats, decimals
 - `num_float = 3.1415`
- Strings
 - `s_str = " Hello World"`

Combining variables in print statements

```
x_int = 1
print(" The integer variable is :", x_int)
```

```
num_float = 3.14
print(" The float variable is :", num_float)
```

```
s_str = ("Hello World'')
print(" The integer is equal to", s_str)
```

Mathematical Operators

- $3 + 4$ # Addition
- $3 - 4$ # Subtraction
- $3 * 4$ # Multiplication
- $3/4$ # Division ($\frac{3}{4}$)
- $3\%4$ # Modulus; Returns the remainder from the division
- $3 ** 4$ # Powers; raise three to the power of four
 - $= 3 * 3 * 3 * 3$
 - $= 3^4$
 - $= \text{pow}(3,4)$

Python

Shell

Mathematical
Operators

Strings

For loops

Consider
this...

Examples of working with strings

```
"hello"+"world" # concatenation
```

```
"hello"*3 #repetition
```

```
"hello"[0] # indexing
```

```
"hello"[-1] # indexing from end
```

```
"hello"[1:4] # slicing out a subsequence
```

```
len("hello") # determine how many characters, size
```

```
"hello" < "jello" # comparison of ABC order
```

```
"e" in "hello" # True, "e" is found in the string
```

```
# General rule:
```

```
single quotes and double quotes are the same
```

```
'abc' == "abc"
```

Working with strings

Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

Characters at the front

```
line = "python programming is fun"  
line.startswith("python") # True  
line.startswith(" python") # False. Why is this?
```

If statements

Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

An if statement is a programming conditional statement that, if proved true, performs a specific function or task. If the condition is false, then another procedure is performed instead.

```
num_int = 5 # Assignment of 5 to variable "num_int"
if num_int == 3: # condition to check
    print(" True") # condition is true
else: # condition is not true
    print(" False") # num_int, is NOT equal to 3
```

```
#make a compressed conditional statement,
# no "else" statement necessary
num_int = 4
if num_int == 4: print("True")
```

If statements

Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

```
name_str = "Bill"
if name_str == "Bill":
    print("Hello Bill!")
else:
    print("You are not Bill.")
    # Place the name in a string to print
    print("Your name is :",name_str)
```

For statements

Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

A for loop is a statement in programming that performs predefined tasks while or until a predetermined condition is met.

```
# counter program
for i_int in range(10):
    print("  Count is:" ,i_int)
    # Note: you could add some conditional
    # if-statement here to check the value of i_int.

# Iterate through the string's chars
s_str = "hello world"
for i_int in s_str:
    print(i_int)
    # Note: you could add an if-statement here
```

For statements

Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

```
# Remember each char of a string has own position
```

```
s_str = "ABC"  
s_str[0] = 'A'  
s_str[1] = 'B'  
s_str[2] = 'C'  
s_str[200] = ??
```

```
# Another way to iterate  
# through a string using its length
```

```
for i_int in range(len(s_str)):  
    print(s_str[i_int])
```

Python

Shell

Mathematical
Operators

Strings

If statements

For loops

Consider
this...

THINK

ToDo

- With the remaining time, write a short program that uses a for loop and a combined if statement
- Your program should count to 5. Each count is checked with an if statement and if the index value is equal to 2 or 3, then your program should print “two” and “three” on a line near the respective index value.

Consider this...

THINK

```
for i_int in range(5):  
    print(i_int)  
<add code here>  
<add code here>
```

Sample output

```
0  
1  
2  
two  
3  
three  
4
```
