Week 6

Logic

Is it logical to say ... ?

Logic

Propositional Logic
And, Or, Not

Truth Tables

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

- Water is *blue*, the shirt is also *blue*, therefore this shirt is made up of water?

Logic

Propositional Logic

And, Or, Not

Truth Tables

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

Logic is ... a **truth-preserving** **system** of **inference**

- **Truth-preserving:** If the initial statements are True, the inferred statements will also be true
- **System:** A set of mechanistic transformations which are based on syntax alone
- **Inference:** The process of deriving (inferring) new statements from old statements (i.e., finding conclusions based on previous observations)

Propositional Logic

Logic

Propositional Logic

And, Or, Not

Truth Tables

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

- A *proposition* is a statement that is either *true* or *false*
- Every proposition is true or false, but its truth value (true or false) may be unknown
- Examples:
 - You are in Discrete Structures (CMPSC102) \rightarrow True
 - Today is Sunday \rightarrow False
 - $1 == 2 \rightarrow$ False
 - It is currently raining in Paris \rightarrow who can say?
 - In Alice's pocket, she has exactly 58 cents \rightarrow who can say?

Different from philosophical assessments of truth...

- Philosopher Ludwig Wittgenstein observed, structures have spatial locations, but facts do not
- The Eiffel Tower can be moved from Paris to Rome, but there is a fact that it is currently in Paris (and nowhere else)
- "Truth" is something of a system of beliefs (i.e., I believe that it is in Paris, because I have seen it there)

Propositional Logic

Logic

Propositional Logic

And, Or, Not

Truth Tables

Implication (uni- directional)

Implication (multi- directional)

Consider This

- A proposition statement:
 - Denoted by a capital letter (i.e., "A")
 - A negation of a proposition statement
 - $\sim A$: "**not** A"
 - Two proposition statements joined by a *connective*
 - $A \wedge B$: "A **and** B"
 - $A \vee B$: "A **or** B"
 - If a connective joins complex statements, parenthesis are added
 - $A \wedge (B \vee C)$: "A and (B or C)"

Propositional Logic

Logic

Propositional Logic

And, Or, Not

Truth Tables

Implication (uni- directional)

Implication (multi- directional)

Consider This

- A = "It is raining"
 - $\sim A$: "not A"
 - "It is **not** raining"
- A = "I will have peanut butter"
- B = "I will have jelly"
 - Sandwich order: $A \wedge B$: "A and B"
 - I will have a sandwich composed of peanut butter **and** Jelly
- A = "I will wear a white t-shirt"
- B = "I will wear a blue t-shirt"
 - I will wear a t-shirt: $A \vee B$: "A or B"
 - I will wear the white **or** the blue t-shirt

Truth Tables

Logic

Truth Tables

Negation

Conjunction

Disjunction

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

- Compound propositional statements are built out of simple statements using logical operations: negations, conjunctions (using *AND*'s) and disjunctions (using *OR*'s)
- Determined by truth tables
 - A table of a combinations of truths using the connectives
 - Truth tables define the truth value of a connective for every possible truth value of its terms

Negation of Proposition

- Negation of proposition A is $\sim A$
- A : It is sunny.
- $\sim A$: It is not sunny.
- A : Newton often drank tea.
- $\sim A$: Newton did not often drink tea.
- A : I am from the planet Zogitron.
- $\sim A$: I am not from the planet Zogitron. (regretfully)

Negation of Proposition

Logic

Truth Tables

Negation

Conjunction

Disjunction

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

Let A be a propositional statement ...

A	$\sim A$
True	False
False	True

In Python

```
True # True  
not True # False  
not False # True
```

```
A = True  
not(A) # False
```

Logical AND (Conjunction)

- Conjunction of A and B is: $A \wedge B$
 - A : We are learning logical expressions
 - B : We are learning Python code for logical expressions
 - $A \wedge B$: We are learning logical expressions and python code for logical expressions

In Python

```
A = True
B = True
A & B # True
A and B # True
```

Logical AND (Conjunction)

Logic

Truth Tables

Negation

Conjunction

Disjunction

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

- Conjunction of A and B is: $A \wedge B$

- A : I like art

- B : I like this work of art

- $A \wedge \sim B$: I like art but I do not like this work of art

In Python

```
A = True
```

```
B = True
```

```
A and not(B) # False
```

Logical AND (Conjunction)

Logic

Truth Tables

Negation

Conjunction

Disjunction

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

Table for Conjunction

A	B	$A \wedge B$
False	False	False
False	True	False
True	False	False
True	True	True

Logical OR (Disjunction)

Logic

Truth Tables

Negation

Conjunction

Disjunction

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

- Also known as the inclusive OR
- Conjunction of A or B is: $A \vee B$
 - A : Today is sunny
 - B : It is Monday
 - $A \vee B$: Today is sunny or it is Monday
- This statement is true if any of the following hold:
 - Today is sunny
 - It is Monday
 - Both
- Otherwise it is false

In Python

```
A = True
B = False
A | B # True
A or B # True
```

Logical OR (Disjunction)

Logic

Truth Tables

Negation

Conjunction

Disjunction

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

Truth Table for Disjunction (Inclusive OR)

A	B	$A \vee B$
False	False	False
False	True	True
True	False	True
True	True	True

Exclusive OR

Logic

Truth Tables

Negation

Conjunction

Disjunction

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

- The inclusive OR is true if either or both arguments are true
- The exclusive OR (\otimes) is true if both arguments are not the same

Truth Table for Exclusive OR (*either or*)

A	B	$A \otimes B$
False	False	False
False	True	True
True	False	True
True	True	False

Implication \rightarrow

Logic

Truth Tables

Implication
(uni-
directional)

Meaning

Implication
(multi-
directional)

Consider This

- The conditional implication connective is \rightarrow
 - $A \rightarrow B$: A implies B
 - *If A is true, then B is also true such that the statement $A \rightarrow B$ is False only when A is True and B is False*
- Logically equivalent to $\sim (A \wedge \sim B) == (\sim A \vee B)$

Truth Table for the Conditional Implication

A	B	$A \rightarrow B$
False	False	True
False	True	True
True	False	False
True	True	True

Implication \rightarrow

Logic

Truth Tables

Implication
(uni-
directional)

Meaning

Implication
(multi-
directional)

Consider This

Implication \rightarrow

Logic

Truth Tables

Implication
(uni-
directional)

Meaning

Implication
(multi-
directional)

Consider This

Truth Table for the Conditional Implication

A = False

B = False

$\text{not}(A) \text{ or } B \# \text{ True}$

A = False

B = True

$\text{not}(A) \text{ or } B \# \text{ True}$

A = True

B = False

$\text{not}(A) \text{ or } B \# \text{ False}$

A = True

B = True

$\text{not}(A) \text{ or } B \# \text{ True}$

Meaning of Conditional Implication (\rightarrow)

Logic

Truth Tables

Implication
(uni-
directional)

Meaning

Implication
(multi-
directional)

Consider This

- A: Homework is due
- B: It is Monday
- $A \rightarrow B$
 - If homework is due, then it must be Monday.
- Can we also conclude...?
 - If it is Monday, then a homework is due.

Implication \leftrightarrow

Logic

Truth Tables

Implication
(uni-
directional)

Implication
(multi-
directional)

Meaning

Consider This

- The conditional implication connective is \leftrightarrow
 - $A \leftrightarrow B$: "A if and only if B",
- Logically equivalent to

$$(A \rightarrow B) \wedge (B \rightarrow A) == (A \wedge B) \vee (\sim A \wedge \sim B)$$

Truth Table for the Conditional Implication

A	B	$A \leftrightarrow B$
False	False	True
False	True	False
True	False	False
True	True	True

Logic

Truth Tables

Implication
(uni-
directional)

Implication
(multi-
directional)

Meaning

Consider This

Implication \leftrightarrow

Logic

Truth Tables

Implication
(uni-
directional)

Implication
(multi-
directional)

Meaning

Consider This

Truth Table for the Conditional Implication

A = False

B = False

$((A \text{ and } B) \text{ or } (\text{not}(A) \text{ and } \text{not}(B))) \# \text{ True}$

A = False

B = True

$((A \text{ and } B) \text{ or } (\text{not}(A) \text{ and } \text{not}(B))) \# \text{ False}$

A = True

B = False

$((A \text{ and } B) \text{ or } (\text{not}(A) \text{ and } \text{not}(B))) \# \text{ False}$

A = True

B = True

$((A \text{ and } B) \text{ or } (\text{not}(A) \text{ and } \text{not}(B))) \# \text{ True}$

Meaning of Conditional Implication (\leftrightarrow)

Logic

Truth Tables

Implication
(uni-
directional)

Implication
(multi-
directional)

Meaning

Consider This

- A: You can buy the shirt
- B: You have enough money
- $A \leftrightarrow B$
 - You can buy the shirt, if and only if, you have enough money (and *vice versa*)
- Can we also conclude...?
 - If you have enough money, then you can buy the shirt.

Consider this

Logic

Truth Tables

Implication
(uni-
directional)

Implication
(multi-
directional)

Consider This

Try coding these...

- Use Python to test the following conditions:
 - $\sim A \vee B$, for $A = \text{True}$ and $B = \text{False}$
 - $\sim A \vee \sim B$, for $A = \text{True}$ and $B = \text{False}$
 - $\sim A \rightarrow B$, for $A = \text{True}$ and $B = \text{False}$

THINK
